Abstract

Let C be an extension-closed variety of finite groups. Two pro-C groups are said to be commensurable if they share a common open subgroup. In this talk we give necessary and sufficient conditions to embed commensurable pro-C as open subgroups of a common overgroup. In the abstract setting, this problem was recently studied by Minasyan and Touikan [1]. We also consider the analogous problem for residually finite groups. (Joint work with Pavel Zalesskii)
